

## Browser Application

Our **Browser Based Timesheet Entry** solution is ideal for companies who's office based staff do not clock IN or OUT but where there is a requirement to record time spent on specific projects. Although the software is designed for non-clocking staff, it can also be used by staff who do clock IN and OUT and enables them to allocate the time spent on individual jobs or contracts directly in **GaneTime**. This eliminates the need to complete manual timesheets and removes the possibility of errors when entering the information via an allocation input screen.

Our **Browser Based** solution has no deployment overheads as it runs on standard internet browser software and is therefore available to anyone with access to a browser enabled machine. All allocation data is validated at source against the tables held in **GaneTime** and therefore it is not possible to enter invalid data. The software allows time to be entered in units as small as 15 minutes to ensure accurate allocation of time. It uses the same database as the Unix version of **GaneTime** and the same login/password combinations are also used. In addition, data exports are the same, whether allocation data is entered using the browser or by some other method.

In summary, the **Browser Based** solution gives you all the functionality of the Unix software but allows you the freedom to choose how you enter the data.

For more information on the **Browser Based Timesheet Entry Solution**, or to arrange a demonstration of the application itself, please contact our office.
